Logical Images Releases VisualDx Version 5.08

New release of clinical decision support tool continues to bring awareness, education, and increased diagnostic accuracy to the point of care.

ROCHESTER, NY, November 30, 2007 – Logical Images is happy to announce the launch of VisualDx Version 5.08. This release builds on the professional decision support system's extensive platform to continue delivering awareness, education, and, most importantly, increased accuracy in diagnosis. Set to be launched at the end of November, VisualDx Version 5.08 introduces the new Pediatric Male and Female Anogenital modules and a MRSA Skin Infections module. These additions drive the VisualDx database to include over 16,000 unique medical images covering over 900 diagnoses.

New Additions in Version 5.08

Pediatric Male and Female Anogenital Modules

Development of these two modules began with a focus on child abuse and diseases that have been mistaken for child abuse, but it evolved into much more. In addition to many disease that are mistaken for abuse as well as different types of child abuse, the Pediatric Male and Female Anogenital modules include injuries, sexually transmitted diseases, benign and malignant lesions, and even normal versus atypical pediatric changes. These modules can be used to evaluate the pediatric anogenital region in infants, children, and teens of all skin types.

MRSA Skin Infections Module

The current CA-MRSA concern dramatically highlights the importance of better recognition, increased diagnostic accuracy, and appropriately targeted therapy for MRSA. With information specific to CA-MRSA skin infections as well as skin and soft tissue infections that can all be caused by infection with *Staphylococcus aureus*, the MRSA Skin Infections module is a comprehensive visual learning aid for all clinicians.
